Explain quantum computing in simple terms

O ChatGPT disse:

Quantum computing is a type of computing that uses the principles of quantum physics to process information. In traditional computing, information is stored in binary form, as either a 0 or a 1.

However, in quantum computing, information is stored in quantum bits or "qubits," which can exist as both a 0 and a 1 at the same time.

This ability to exist in multiple states simultaneously allows quantum computers to perform certain calculations much faster
